Mission Highlights

Carried out by Endeavour on February 11, 2000. The Shuttle Radar Topography Mission (SRTM) was an international project spearheaded by the National Imagery and Mapping Agency and NASA, with participation of the German Aerospace Center DLR. Its main objective was to obtain the most complete high-resolution Digital Topography database of the Earth. The SRTM payload consists of a specially modified radar system that was flown onboard the space shuttle during the 11-day Mission. The radar system gathered around 10 Terabytes of raw data to become the foundation of an unrivalled high resolution database of Earth's topography. The SRTM database has since been processed and has proved to be an invaluable component for GIS, Flight simulation and Earth Sciences applications.

Payload

Shuttle Radar Topography Mission (SRTM) hardware. The hardware consists of a mast and an antenna. Made of Carbon Fiber Reinforced Plastic (CFRP), stainless steel, Alpha Titanium, and Invar, the mast is a truss structure that consists of 87 cube-shaped sections called bays. Unique latches on the diagonal members of the truss all the mechanism to deploy bay-by-bay out of the mast canister to a length of 200 feet, about the length of 5 school buses. A canister houses the mast during launch and landing and also deploys and retracts the mast. The outboard antenna structure is connected to the end of the mast. It contains C-Band and X-Band antenna, two Global Positioning System Antenna, light emitting Diode targets, and a corner-cube reflector. The two outboard antenna can only receive radar signals.

Transmitting of radar signals will be done only by the main antenna.

Additional experiments carried onboard the Shuttle during the mission include the Heat Exchange Unit Urine Collection Device, Single-String Global Positioning System with PGSC and GPS, High Definition Television (HDTV) Camcorder Demonstration, Crosswind Landing, Effect of Space Flight on Bone, Muscle, and Immune Function, monitoring Latent Virus Reactivation and Shedding in Astronauts, Individual Susceptibility to Post-Space-Flight Orthostatic Intolerance, Space Flight and Immune Functions, Educational Activities.

Flight Summary

Launchpad: Kennedy Space Center (KSC) 39A | Orbit: 127NM | Inclination: 57 | Orbits: 181

Duration: 11 Days, 5 Hours, 39 Minutes, 41 Seconds | Landing: Kennedy Space Center
